xpath By axes

XPath by Axes is used to locate a web element based on the relationship between two elements in the webpage. It helps us navigate forward, backward, up, and down in the DOM tree using axes:

such as parent, child, ancestor, descendant, following-sibling, and preceding-sibling.

Syntax:

//tagname[@attribute='value']/axisname::tagname

//tagname[text()='textvalue']/axisname::tagname

```
Run | Debug | Inspect
test.only("XpathByaxes",async({page})=>{
await page.goto("https://demowebshop.tricentis.com/")
await page.locator
("//a[text()='14.1-inch Laptop']/ancestor::div[@class='product-item']//input[@value='Add to cart']").click()
await page.waitForTimeout(2000)
})
```
